

Client	Hayfield Homes		
Project Title	Pixiefields	Project No	18019
Prepared By	S.Marshall	Date	8 March 2019
Subject	Reserved Matters Drainage Strategy	Revision	-

Introduction

Outline Planning Permission¹, for up to 51 dwellings on land off Pixiefields in Cradley, Herefordshire, with all matters reserved except for access was granted on 30 July 2018 and included the following drainage related conditions:

- 9) Unless otherwise agreed in writing the adoptable highway and all pedestrian / cycle routes shall not exceed a gradient of 1:12 and no private drive shall exceed a gradient of 1:8. Private drainage arrangements must be made to prevent run-off from private driveways onto the public highway.
- 15) Prior to commencement of the development hereby permitted the following matters shall be submitted to the Local Planning Authority for their written approval:-
 - Drainage plans for the disposal of foul and surface water flows.

Existing Conditions

The Site extends to 2.39 hectares of grazing land to north of Pixiefields at approximate National Grid Reference 372385, 246845.

The Site is bounded by:

- Chockbury Lane, to the north,
- Dwellings of Pixiefields estate, to the south,
- Dwellings of Credenleigh and Chockbury Lane, to the east,
- A single-track lane, to the west.

Ground levels within the Site fall from northwest to southeast from approximately 111.0mAOD to 96.2mAOD.

Background Reports

A Flood Risk Assessment² was prepared by Hydro-Logic Services LLP in support of the outline planning application.

The Flood Risk Assessment concluded:

- The Site is located within Flood Zone 1 and 'flooding from any source is regarded as highly unlikely'.
- Infiltration rates, of between1.4x10⁻⁶m/s and 1.1x10⁻⁷m/s, were calculated for five test pits located across the Site.
- Surface water runoff would be directed to two infiltration basins, one located in the southwest corner of the Site with an additional restricted discharge to the offsite Cradley Brook, the other located in the southeast corner of the Site with an additional restricted discharge to the surface water drainage network serving Pixiefields.

There is a lack of certainty as to how the infiltration tests were conducted and rates calculated, thus we would recommend caution when interpreting these results. The test results³ presented in Appendix E

¹ Herefordshire Council Application No: 174057

² Report Ref: K0488/1 (Rev.4) dated October 2017

³ BM Evans Groundwork & Drainage letter dated 23rd June 2014

Project No 18019

of the Flood Risk Assessment describe the time taken for the test water to drop 1mm. This presentation of results is consistent with the percolation test method described within BS 6297, relating to the design and installation of drainage fields for use in wastewater treatment, whereas the methodology described within BRE Digest 365, relating to the calculation, design and construction procedures for soakaways, is applicable in this instance.

Notwithstanding the uncertainties surrounding the infiltration test method Hydro-Logic Services LLP have made several, reasonable, assumptions when calculating infiltration rates form the very limited information provided by BM Evans Groundwork & Drainage. However, should any of these assumptions be incorrect then the resultant infiltration rates would also be incorrect.

Despite the very low infiltration rates calculated, the surface water drainage strategy described within the Flood Risk Assessment largely relies upon infiltration techniques as the primary method of surface water disposal.

The table below summarises the baseline Greenfield runoff rates presented within the Flood Risk Assessment which were calculated using the IH 124 methodology.

Return Period (years)	Greenfield Runoff (l/s/ha)
QBAR	3.275
100	9.405

Table 1 – Flood Risk Assessment Calculated Greenfield Runoff Rates

The following table summarises the published parameters that were adjusted by Hydro-Logic within the Greenfield runoff calculations.

Parameters	Published	Adjusted
SAAR	707mm	745mm*
Soil	0.3	0.4

*SAAR4170 Figure

Table 2 – Flood Risk Assessment Adjusted Greenfield Runoff Parameters

It should be noted that Greenfield runoff rates are increased as a result of the adjusted parameters,

The proposed restricted discharges from the southwest and southeast infiltration basins, 1.13l/s and 0.77l/s respectively, are considered lower than the practical minimum rate to minimise the risk of blockage within the control device. The stated 30-50mm diameter orifices required to achieve these proposed rates are considered to have a high blockage risk.

Whilst it is stated the route of the offsite outfall into the Cradley Brook has been agreed in principle with the third-party landowner in the absence of written evidence this should be considered speculative.

Development Proposals

Referring to the Hayfield Homes Proposed Site Layout⁴ 51 dwellings are proposed.

Surface Water Drainage Appraisal

Pre-development Runoff Rates

Greenfield Runoff:

The 'CIRIA C753 – The SuDS Manual' states that whilst several methods are available for calculating peak runoff rates, and volumes, the more recent FEH⁵ methods should be the preferred approach. It is noted that whilst the IoH 124 method used within the Hydro-Logic Flood Risk Assessment can still be used as an alternative, with the agreement of the approving body, it is more likely to underestimate runoff rates potentially leading to the overdesign of attenuation storage components.

The following table provides a comparison of the Greenfield runoff rates described within the Flood Risk Assessment, those calculated using the unadjusted IH 124 parameters and the newer FEH methodology.

Return Period	Greenfield Peak Flow (l/s/ha)		
	IoH 124	IH 124	ReFH2
	(Flood Risk Assessment	(unadjusted	
	adjusted parameters)	parameters)	
Qbar	3.7	1.8	2.1
100 year	9.4	4.7	6.2

Table 3 – Greenfield Runoff Rate Comparison

As expected, the adjusted parameters used within the Flood Risk Assessment result in overestimated Greenfield runoff rates. It is recommended that the ReFH2 method is adopted for design purposes.

Disposal Options - Summary

We do not consider the strategy proposed within the Flood Risk Assessment to be appropriate for several reasons, including but not limited to:

- The uncertainty surrounding the infiltration testing/calculation method.
- The uncertainty surrounding the approval of third-party landowners to discharge surface water into the Cradley Brook.
- The stated infiltration rate being too low to offer a viable drainage solution.
- The stated restricted discharge being too low to offer a viable drainage solution.

We would recommend additional infiltration testing is undertaken, in full accordance with BRE Digest 365, to inform the detailed design stage. The testing should be targeted specifically within the southeast corner of the Site although multiple test locations across the Site would be beneficial. A Borehole should also be drilled in the southeast corner, to at least 4mbgl, to monitor groundwater levels.

Due to the topography of the Site it is recommended that all surface water is directed to a primary attenuation feature in the southeast corner of the Site. Should the results of subsequent infiltration testing demonstrate that infiltration is suitable, either as a partial or total drainage solution, then an infiltration basin should be provided. Should the results of the testing conclude that infiltration techniques are unsuitable then a detention basin should be provided.

A restricted overflow/outlet from the infiltration/detention basin into the public surface water sewerage serving the Pixiefields estate is be provided, subject to Severn Trent Water approval. It should be noted that as records show this sewerage discharges into a tributary of the Cradley Brook a direct connection from the Site across third-party land to the Cradley Brook is unnecessary.

⁵ Flood Estimation Handbook Project No 18019

Recommended Preliminary Design Parameters

(Subject to Severn Trent Water/Lead Local Flood Authority approval)

Description	Preliminary Design Parameter
Post-Development Impermeable Area	1.065 ha
Permissible Rate of Discharge	5 l/s
Design Rainfall	FEH
Attenuation Storage – 30 year	Adoptable network / Basin
Attenuation Storage – 100 year + CC	Offline Tanked Storage (below POS) / Basin
Development Flood Protection	100 year + Climate Change
Climate Change allowance	40%

Table 4 – Preliminary Design Parameters

Preliminary Attenuation Storage Estimate

Return Period (years)	Climate Change Allowance	Attenuation Storage Estimate (m ³)	
		No Infiltration	Partial Infiltration (1.4x10 ⁻⁶ m/s)
30	0%	347 - 470	282 - 459
100	20%	593 – 744	475 - 722
	40%	714 – 903	561 - 863

Table 5 – Preliminary Attenuation Storage Estimate

Foul Water Drainage Appraisal

A gravity connection to the public foul water sewer within the Pixiefields estate is viable, subject to Severn Trent Water approval.

Severn Trent Water Approval

A Development Enquiry Request has been submitted to Severn Trent Water. This Technical Note will be updated upon receipt of a response.

Recommendations

Infiltration testing, in full accordance with BRE Digest 365, should be undertaken.

Groundwater monitoring should be undertaken in the southeast corner of the Site.

The detailed design stage should give priority to infiltration techniques, where deemed appropriate.

Drawings

Project No 18019

Cavendish House, 10-11 Birmingham Street, Halesowen, West Midlands, B63 3HN • Tel: 0121 687 1500

Scale 1:500 @ A1

© This drawing and the building works depicted are the copyright of Banners Gate Ltd and may not be reproduced or amended except by written permission. No liability will be accepted for amendments made by other persons. The Contractor is to check and verify in conjunction with the Architects details all setting out points, building and site dimensions, levels and sewer invert levels at connection points and ensure that they are fully conversant with the contents and requirements of the site investigation report before work starts. The Contractor is to comply in all respects with current building legislation, British Standard Specifications, Building Regulations etc., whether or not specifically stated on this drawing. This drawing is not intended to show details of ground conditions or ground contaminants. Each area of ground relied upon to support any structure depicted (including drainage) must be investigated by the Contractor any areas of formation for said structures which do not accord with the anticipated conditions as described in the site investigation report are to be immediately notified to the Engineer, where applicable. Any suspect fluid ground or ground contaminants on or within the ground should be investigated further by a suitable expert. Any earthworks shown indicate twoical slopes for quidance only and should be investigated further by a suitable earthworks shown indicate typical slopes for guidance only and should be investigated further by a suitable geotechnical expert. Where existing trees are shown to be retained they should be subject to a full Arboricultural inspection for safety. All trees are to be planted so as to ensure they are a minimum of 5 metres from buildings and 3 metres from drainage and services, where applicable. A foundation is to be provided to accommodate the proposed tree elements where are the services are subjected by the service of the services are services and services and the services are services and services are services and services are subjected by the services are services and services and services are services and services and services are services are services and services are services and services are services are services are services are services and services are tree planting, where applicable.

GENERAL NOTES

- This drawing is to be read in conjunction with relevant architectural and engineering drawings.
 Levels indicated in blocks are Finished floor levels and are 150mm above adjacent finished ground levels unless otherwise shown.
 Levels of the existing road at the point of tie-in with proposed site road must be checked prior to commencement of works.
 Any discrepancies between the details shown and actual on site conditions to be reported immediately to the engineer prior to commencement of works.

ADOPTABLE ROADS AND SEWERS

- Roads, footways and parking bays which form part of the highway to be adopted under Section 38 of the Highways Act 1980 shall comply with the requirements of the Adopting Authority. Sewers to be adopted under Section 104 of the Water Industries Act 1991 shall comply
- with the Water Authorities Association "Sewers for Adoption 6th or 7th Edition" with any amendments specified by the Adopting Water Authority. All pipes to be used in adoptable severage shall be either clayware to BS EN 295 or concrete to BS EN 1916 and BS 5911: Part 1 with Class S bedding unless otherwise stated. With approval of the Adopting Authority solid wall concentric external rib reinforced uPVC pipes complying with the relevant provisions of BS EN 13476 may be used.
- Where cover to a pipe is more than 1200mm under adoptable carriageway the trench shall be filled to formation of the carriageway with well compacted DTp Type 1 material.
 Where cover to a pipe is less than 1200mm under adoptable carriageway it shall be provided with concrete protection in accordance with the specification of the adopting authority and back filled to formation of the carriageway with well compacted DTp Type 1 material. Where concrete bed and surround is specified flexibility of joints is to be
- maintained by using compressible bitumen impregnated fibreboard at each pipe joint.
 All existing drainage invert levels, diameters and locations are to be checked by the Contractor prior to the commencement of any proposed drainage work. Any difference between actual and drawn details is to be reported to the Engineer immediately.
- Positions of existing services/statutory undertakers apparatus adjacent to or crossing proposed sewers is to be checked by the Contractor prior to starting work.
- Drainage Strategy Notes: The foul water gravitates & outfalls to an existing MH located in the south-east corner of the site within Pixiefields & totals 51 'units', subject to S106/S104 approval with Severn Trent.
- The storm water drainage gravitates & outfalls into an existing MH located in the south-east corner of the site within Pixiefields. Storm water storage equates to 619m³ of storage required within a pond for the 30yr storm event, with 288m³ required in cellular storage for up to and including 100yr + 40% storm event.
 Discharge rate is 5 l/s as per concept levels & drainage prepared by RPS. Subject to
- approvals from Severn Trent Water, Environment Agency & The Lead Local Flood Authority.
